

## Steps to Check the MX Values:

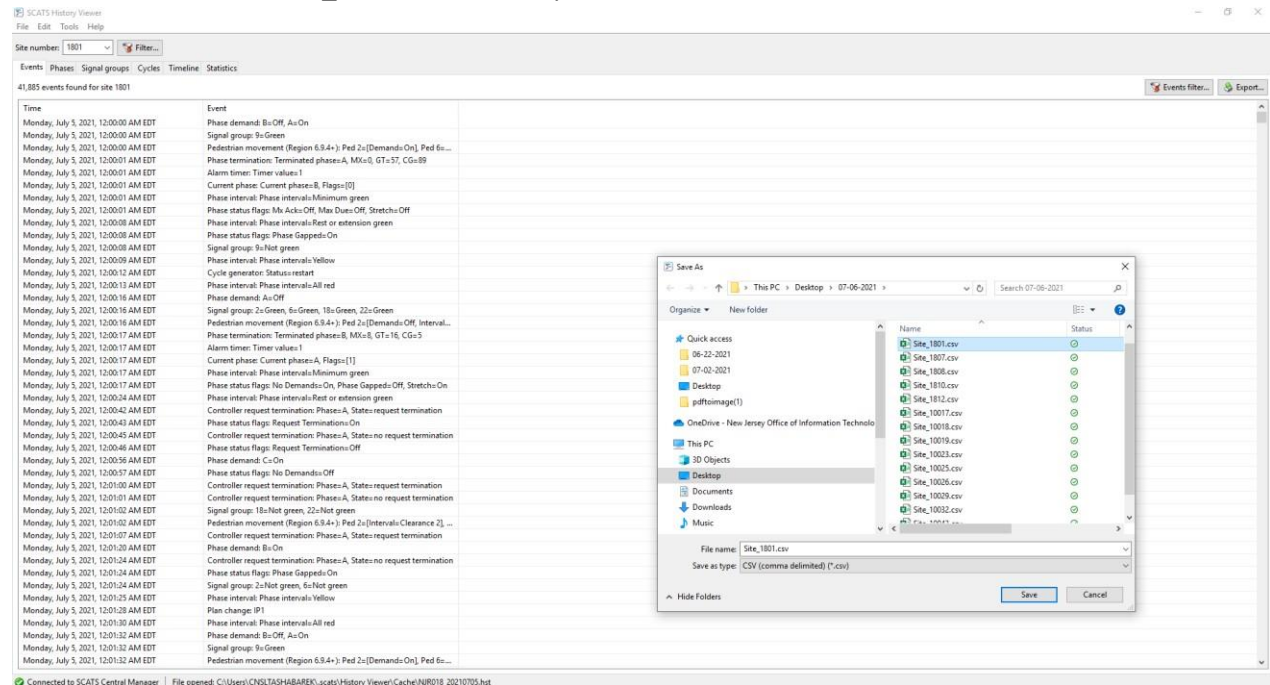

### 1- Go to each site from SCATS History View and choose the day you want to perform the check on

### 2- From the "Event" tab make sure you check all the Event types as shown in the figure below by clicking on Events filter and checking all the types.

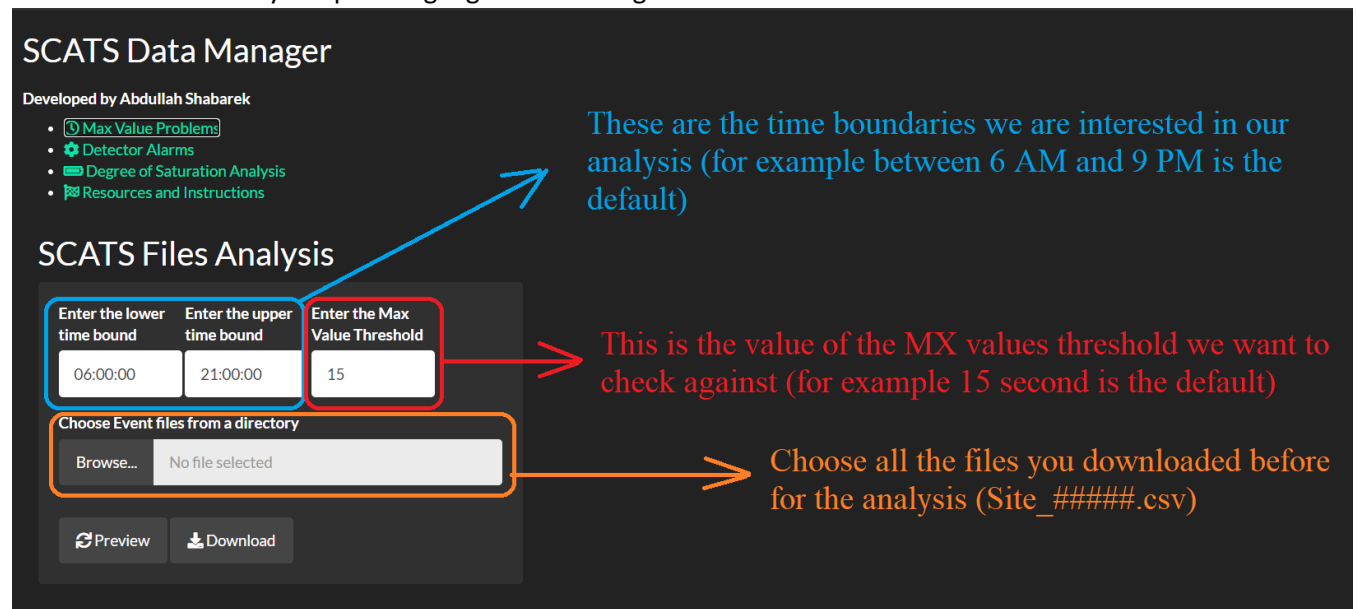

3- Click on Export button and save the file in the following format “Site\_#”. For example, Site# 1801 needs to be saved as “Site\_1801.csv” and keep it in one folder for ease as shown below:

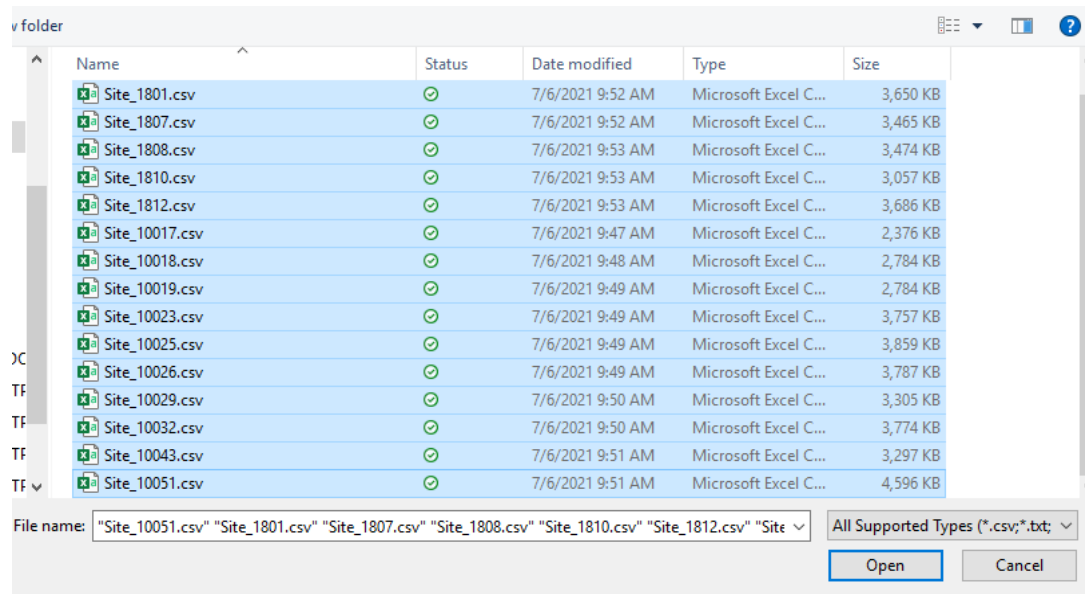

4- Repeat the process for all the intersection you want to check on by changing the site number in History view if it is the same route or clicking File → Load History Data and change the site if it is a different route.

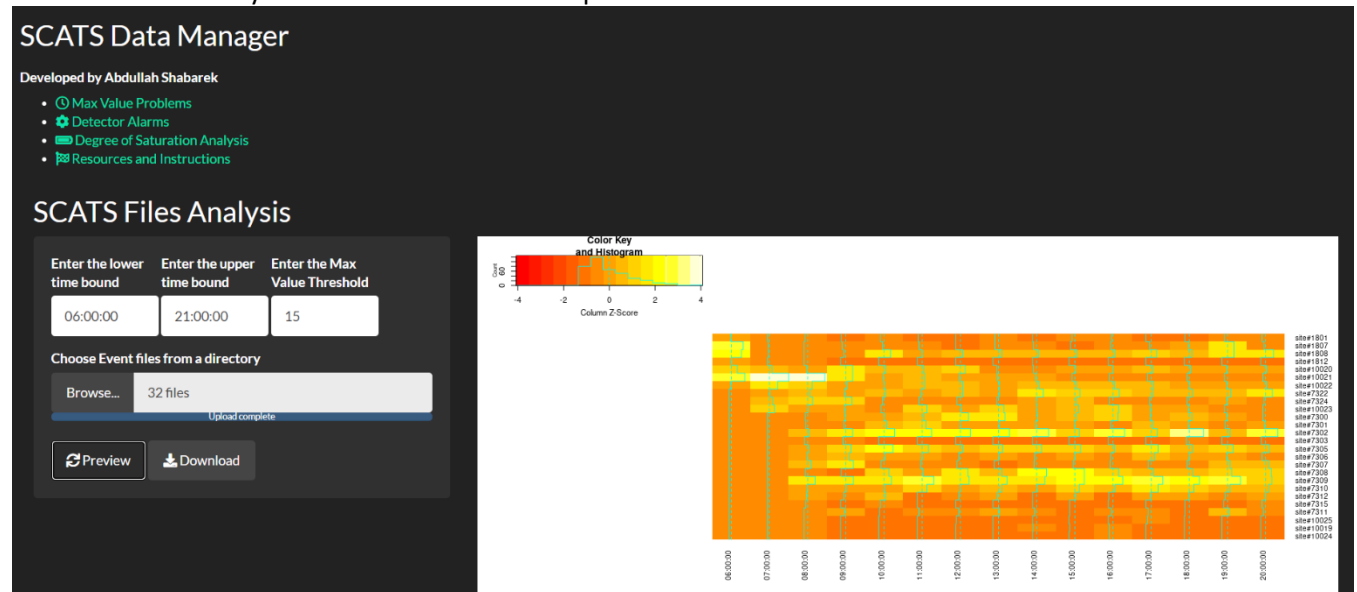

5- Once done with all the sites you need to check, go to this [link](#) and Choose the tab “Max Value Problems” and fill only the parts highlighted in the figure below:

6- Choosing all the files you downloaded before can be done as following:

7- Once you choose the files, and depending on how many files, give it around 1 minute and then hit “Preview” Button if you want to see the heatmap of the critical sites.

8- To download the data and see the actual numbers of occurrence, hit “Download” button
